1. Use-case model: Design a use-case model for your project by translating your functional requirements into simple use-cases. Use the names for the actors that are relevant to your project. For example, if your project is a Dog Grooming app, the customer would be called the Dog Owner, the provider would be called the Groomer or Technician, and the SysAdmin would be the Salon Owner. For each actor, annotate with the name of the group member responsible for the implementation.
